

A Data sources

ARCHS4 mouse

997,515 profiles audited
17,244 selected across 20 tissues
Complete GEO-series splits

NASA OSDR API

1,610 biological profiles
75 accessions; FLT/GC labels
Study and material retained

Biological scope

Pooled multi-tissue generation
Tissue-specific analysis
Skeletal-muscle groups retained

B Configurable generative benchmark

Expression

Raw, CPM, TPM
log transforms
z-score, robust, MaxAbs

Harmonization

None; two study z-scores
ComBat/ComBat-seq
MBatch; MOBER

Generator

WGAN-GP; DDIM
GeneJEPA screened as
representation only

Training scope

OSDR only; ARCHS4 only
ARCHS4 pretrain plus
OSDR adaptation

Cohort structure

One or many studies
pooled or per tissue
accession balancing

Conditioning

FLT/GC; tissue; study
material; muscle group
and available covariates

C Generator metrics and model choice

WGAN-GP

Corr. 0.976; F1 0.985
AA 0.636; muscle recovery 0/6

DDIM

Corr. 0.974; F1 0.997
AA 0.475; muscle recovery 4/4

Downstream model

Lower AA and FD; muscle recovery 4/4
DDIM used for downstream analysis

AA near 0.5 indicates lower separability; generated profiles were never counted as additional animals.

D Five tissue-specific uses of generated expression

Training views

Real OSDR

Observed FLT/GC profiles

DDIM generated

Matched conditional profiles

Candidate arm fitted within each tissue

Real only

Rank: real
Fit: real

Generated only

Rank: generated
Fit: generated

Real + synth.

Rank: consensus
Fit: equal real/synth.

Guided; real fit

Rank: consensus
Fit: real

Guided; 5% synth.

Rank: consensus
Fit: real + 5% synth.

Within-study real-profile evaluation

BA, AUROC, AP on real holdouts
Profiles split within accession
Eligible arm selected per tissue

Selected arm -> repeated stable genes; FLT/GC effects and BH-FDR are calculated from real OSDR only
